## **Grid Regeneration**

The site was chosen based on the growth of Salina before and after the removal of the canal and dredging of the lake. The approach was to take an existing grid condition and apply it an undeveloped region by fully removing all existing infrastructure and replacing it with just the street network. The existing grid chosen was the original Salina street network due to its socio-economic heterogeneity. By allowing this grid to extend into the site and grow around certain immovable objects a new neighborhood and

infrastructure would emerge. This network would allow for a connection of the downtown city to the lake. From a rehabilitation standpoint the site and lake front would be altered by a set of piers and canals. These piers will serve two purposes, one to extend the street network out into the lake and interweave the lake more with the city, and second to serve as a method of both containment and new shoreline. The piers would contain the lager amounts of mercury in the lake and the also create a new

shoreline to promote aquatic life. The canals would serve as a natural way of filtering both METRO and Onondaga creek before entering the lake.
