Axiomatization of Some Natural Language
Quantifiers

William C. Purdy*

November 1990

*School of Computer and Information Science, Syracuse University
Abstract

This paper extends an existing logic, $\mathcal{L}_N$, to some of the generalized quantifiers of natural language. In contrast to the usual approach, this extension does not require the identity relation. Sommers has suggested that the identity is unnecessary in a logic that properly treats singular terms. This paper lends support to Sommers position.

$\mathcal{L}_N$ is a logic designed for natural language reasoning (see [3]). This paper defines an extension, $\mathcal{L}_{NQ}$, of that logic to include the cardinal quantifiers, at least $n$, and the second-order quantifier, most. Because of the limited expressiveness of first-order languages, a complete axiomatization for most is not possible. However incompleteness does not negate the usefulness of the axiomatization for natural language reasoning. Theorems, generalizing those of [3], are given. These theorems establish the properties of monotonicity, conservativity, and conversion for $\mathcal{L}_{NQ}$.

These results are of interest in connection with Sommers position that by endowing singular terms with "wild quantity," identity as a logical operator is not needed. This in turn results in a logic that is simpler and more closely conforms to natural language.
1 Introduction \( \mathcal{L}_N \), a logic designed for natural language reasoning, was presented in [3]. This paper defines an extension, \( \mathcal{L}_{NQ} \), of that logic to include the cardinal quantifiers, at least \( n \), and the second-order quantifier, most. Because of the limited expressiveness of first-order languages, a complete axiomatization for most is not possible. Incompleteness does not negate the usefulness of the axiomatization for natural language reasoning however. Theorems, generalizing those of [3], are given. These theorems establish the properties of monotonicity, conservativity, and conversion for \( \mathcal{L}_{NQ} \).

The extension is also of interest in another connection. Sommers has taken the position (see “Do We Need Identity?” in [4]) that by endowing singular terms with “wild quantity,” e.g., recognizing that some Socrates is human is logically equivalent to all Socrates is human, identity as a logical operator is not needed. Elimination of the identity relation results in a simpler logic, and one that more closely conforms to natural language.

\( \mathcal{L}_N \) incorporates a version of Sommers’ position. It has no identity relation. It defines certain predicates as singular. Semantically, singular predicates denote singleton sets of individuals. Syntactically, they are endowed with wild quantity (by axiom S2) and existential import (by axiom S1). It is shown in [3] that the expressiveness of the logical identity relation can be attained in \( \mathcal{L}_N \) through the use of schemas.

In a first-order language with identity, the cardinal quantifiers are usually introduced by definition (e.g., [1]). The quantifier most cannot be introduced in this way. In
$\mathcal{L}_{\neg NQ}$, both are established by axiom schemas.

Of course, either approach is available in a first-order language with identity. But the demonstration in this paper that $\mathcal{L}_{\neg NQ}$, a first-order language without identity, has sufficient expressiveness to axiomatize these quantifiers lends support to Sommers' position on the identity relation.
2 Definition of the Language  

The alphabet of $\mathcal{L}_{NQ}$ consists of the following.

1. Predicate symbols $\mathcal{P} = \mathcal{S} \cup (\bigcup_{i \in \omega} \mathcal{R}_i)$ where $\mathcal{R}_j = \{R^i_j : i \in \omega\}$, $\mathcal{S} = \{S_i : i \in \omega\}$, and $\mathcal{S}$ and the $\mathcal{R}_j$ are mutually disjoint.

2. Selection operators $\{\langle k_1, \ldots, k_n \rangle : n \in (\omega - \{0\}), k_i \in (\omega - \{0\}), 1 \leq i \leq n\}$.

3. Quantifiers some, $\{k : k \in (\omega - \{0\})\}$, and most.

4. Boolean operators $\cap$ and $\neg$.

5. Parentheses ( and ).

$\mathcal{L}_{NQ}$ is partitioned into sets of $n$-ary expressions for $n \in \omega$. These sets are defined to be the smallest satisfying the following conditions.

1. Each $S_i \in \mathcal{S}$ is a unary expression.

2. For all $n \in \omega$, each $R^n_i \in \mathcal{R}_n$ is a $n$-ary expression.

3. For each predicate symbol $P \in \mathcal{P}$ of arity $m$, $\langle k_1, \ldots, k_m \rangle P$ is a $n$-ary expression where $n = \max(k_{i \leq i \leq m})$.

4. If $X$ is a $n$-ary expression then $\overline{X}$ is a $n$-ary expression.

5. If $X$ is a $m$-ary expression and $Y$ is a $l$-ary expression then $(X \cap Y)$ is a $n$-ary expression where $n = \max(l, m)$.

6. If $X$ is a unary expression and $Y$ is a $(n + 1)$-ary expression then $(\text{some}XY)$ is a $n$-ary expression.
7. If \( X \) is a unary expression and \( Y \) is a \((n + 1)\)-ary expression then \((kXY)\) is a
\(n\)-ary expression for each \( k \in (\omega - \{0\}) \).

8. If \( X \) is a unary expression and \( Y \) is a \((n + 1)\)-ary expression then \((\text{most}XY)\) is
a \(n\)-ary expression.

In the sequel, superscripts and parentheses are dropped whenever no confusion can result. Metavari-
biables are used as follows: \( S \) ranges over \( \mathcal{S} \); \( R^n \) ranges over \( \mathcal{R}_n \); \( P \)
ranges over \( \mathcal{P} \); \( X, Y, Z, W, V \) range over \( \mathcal{L}_{\mathcal{NQ}} \); and \( X^n, Y^n, Z^n, W^n, V^n \) range over \(n\)-
ary expressions of \( \mathcal{L}_{\mathcal{NQ}} \). Applying subscripts to these symbols does not change their
ranges.

An interpretation of \( \mathcal{L}_{\mathcal{NQ}} \) is a pair \( \mathcal{I} = (\mathcal{D}, \mathcal{F}) \) where \( \mathcal{D} \) is a finite nonempty set and
\( \mathcal{F} \) is a mapping defined on \( \mathcal{P} \) satisfying:

1. for each \( S_i \in \mathcal{S}, \mathcal{F}(S_i) = \{d\} \) for some (not necessarily unique) \( d \in \mathcal{D} \), and

2. for each \( R^n \in \mathcal{R}_n \), \( \mathcal{F}(R^n) \subseteq \mathcal{D}^n \).

Let \( \alpha = \langle d_1, d_2, \ldots \rangle \in \mathcal{D}^\omega \) (a sequence of individuals). Then \( X \in \mathcal{L}_{\mathcal{NQ}} \) is satisfied by
\( \alpha \) in \( \mathcal{I} \) (written \( \mathcal{I} \models_{\alpha} X \)) iff one of the following holds:

1. \( X \in \mathcal{P} \) with arity \( n \) and \( \langle d_1, \ldots, d_n \rangle \in \mathcal{F}(X) \)

2. \( X = \langle k_1, \ldots, k_m \rangle P \) where \( P \in \mathcal{P} \) with arity \( m \) and \( \langle d_{k_1}, \ldots, d_{k_m} \rangle \models P \)

3. \( X = \overline{Y} \) and \( \mathcal{I} \not\models_{\alpha} Y \)
4. $X = Y \cap Z$ and $\mathcal{I} \models_{\alpha} Y$ and $\mathcal{I} \models_{\alpha} Z$

5. $X = \text{some}Y^1Z^{n+1}$ and for some $d \in \mathcal{D}$, $\langle d \rangle \models Y^1$ and $\langle d \rangle \models Z^{n+1}$

6. $X = kY^1Z^{n+1}$ and $\text{card}(\{d \in \mathcal{D} : \langle d \rangle \models Y^1 \text{ and } \langle d \rangle \models Z^{n+1}\}) \geq k$

7. $X = \text{most}Y^1Z^{n+1}$ and $\text{card}(\{d \in \mathcal{D} : \langle d \rangle \models Y^1 \text{ and } \langle d \rangle \models Z^{n+1}\}) > \text{card}(\{d \in \mathcal{D} : \langle d \rangle \not\models Y^1 \text{ or } \langle d \rangle \not\models Z^{n+1}\})$

where $\mathcal{I} \not\models_{\alpha} X$ is an abbreviation for $\text{not}(\mathcal{I} \models_{\alpha} X)$ and $\langle d_{i_1}, \ldots, d_{i_n} \rangle \models X$ is an abbreviation for $\mathcal{I} \models_{(d_{i_1}, \ldots, d_{i_n}, d_1, d_2, \ldots)} X$.

$X$ is true in $\mathcal{I}$ (written $\mathcal{I} \models X$) iff $\mathcal{I} \models_{\alpha} X$ for every $\alpha \in \mathcal{D}^\omega$. $X$ is valid (written $\models X$) iff $X$ is true in every interpretation of $\mathcal{L}_{NQ}$. A 0-ary expression of $\mathcal{L}_{NQ}$ is called a sentence. A set $\Gamma$ of sentences is satisfied in $\mathcal{I}$ iff each $X \in \Gamma$ is true in $\mathcal{I}$.

The following abbreviations are introduced to improve readability.

1. $\check{R}^n := \langle n, \ldots, 1 \rangle R^n$

2. $X \cup Y := \overline{(X \cap \overline{Y})}$

3. $X \subseteq Y := \overline{(X \cap \overline{Y})}$

4. $X \equiv Y := (X \subseteq Y) \cap (Y \subseteq X)$

5. $T := (S_0 \subseteq S_0)$

6. $\text{some}X_n\text{some}X_{n-1} \cdots \text{some}X_1Y := (\text{some}X_n(\text{some}X_{n-1} \cdots (\text{some}X_1Y) \cdots))$
7. \( \text{some} X^1 Y^2 \circ Y^2_{n-1} \circ \cdots \circ Y^2_1 := (\text{some} \cdots (\text{some}(X^1 Y^2_n) Y^2_{n-1}) \cdots Y^2_1) \)

8. \( \text{all} X^1 Y := \overline{\text{some} X^1 Y} \)

9. \( \text{no} X^1 Y := \overline{\text{some} X^1 Y} \)

10. \( !k X^1 Y := k X^1 Y \cap (k+1) X^1 Y \)

11. \( \check{k} X^1 Y := \overline{k X^1 Y} \)

It is easy to see that:

1. \( \mathcal{I} \models_{\alpha} X \cup Y \iff (\mathcal{I} \models_{\alpha} X \lor \mathcal{I} \models_{\alpha} Y) \)

2. \( \mathcal{I} \models_{\alpha} X \subseteq Y \iff (\mathcal{I} \models_{\alpha} X \implies \mathcal{I} \models_{\alpha} Y) \)

3. \( \mathcal{I} \models_{\alpha} X \equiv Y \iff (\mathcal{I} \models_{\alpha} X \iff \mathcal{I} \models_{\alpha} Y) \)

4. \( \mathcal{I} \models_{\alpha} T \) for every \( \mathcal{I} \) and \( \alpha \)

5. \( \mathcal{I} \models_{\alpha} \text{some} X^1 Y^2 \circ \cdots \circ Y^2_i \) iff for some \( d \in \mathcal{D}, \langle d \rangle \models X^1 \) and \( \langle d \rangle \models Y^2 \circ \cdots \circ Y^2_i \)

where \( \circ \) denotes composition of relations in \( \mathcal{I} \)

6. \( \mathcal{I} \models_{\alpha} \text{all} X^1 Y \) iff for all \( d \in \mathcal{D}, \langle d \rangle \models X^1 \) implies \( \langle d \rangle \models Y \)

7. \( \mathcal{I} \models_{\alpha} \text{no} X^1 Y \) iff for all \( d \in \mathcal{D}, \langle d \rangle \models X^1 \) implies \( \langle d \rangle \not\models Y \)

8. \( \mathcal{I} \models_{\alpha} !k X^1 Y \) iff \( \text{card}(\{d \in \mathcal{D} : \langle d \rangle \models X^1 \text{ and } \langle d \rangle \models Y\}) = k \)

9. \( \mathcal{I} \models_{\alpha} \check{k} X^1 Y \) iff \( \text{card}(\{d \in \mathcal{D} : \langle d \rangle \models X^1 \text{ and } \langle d \rangle \models Y\}) < k \)
3 Axiomatization of $\mathcal{L}_{NQ}$  

The axiom schemas of $\mathcal{L}_{NQ}$ are the following.

BT. Every schema that can be obtained from a tautologous Boolean wff by uniform substitution of nullary metavariables of $\mathcal{L}_{NQ}$ for sentential variables, $\land$ for $\land$, and $\neg$ for $\neg$

C1. $\text{some}S_{i_1} \cdots \text{some}S_{i_l}(k_1, \ldots, k_m)P \subseteq \text{some}S_{i_{k_m}} \cdots \text{some}S_{i_{k_1}} P$ where $P$ is of arity $m$ and $n = \max(k_j)_{1 \leq j \leq m}$

C2. $\text{some}S_{i_1} \cdots \text{some}S_{i_l}(\overline{k_1, \ldots, k_m})P \subseteq \text{some}S_{i_{k_m}} \cdots \text{some}S_{i_{k_1}} \overline{P}$ where $P$ is of arity $m$ and $n = \max(k_j)_{1 \leq j \leq m}$

S1. $\text{some}SS$

S2. $\text{some}S_{i_1} \cdots \text{some}S_{i_l}(\text{some}S_{X^{n+1}}) \equiv \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{some}S_{X^{n+1}}$

D. $\text{some}S_{i_1} \cdots \text{some}S_{i_l}(X^m \cap Y^l) \equiv (\text{some}S_{i_{m}} \cdots \text{some}S_{i_l}X^m \cap \text{some}S_{i_l} \cdots \text{some}S_{i_1}Y^l)$

where $n = \max(l, m)$

EG. $(\text{some}S_{X^1} \cap \text{some}S_{i_1} \cdots \text{some}S_{i_l} \text{some}S_{Y^{n+1}}) \subseteq \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{some}S_{X^1Y^{n+1}}$

KG1. $\text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{some}X^1Y^{n+1} \equiv \text{some}S_{i_1} \cdots \text{some}S_{i_l}1X^1Y^{n+1}$

KG2. $(\text{some}S_{X^1} \cap \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{some}S_{Y^{n+1}} \cap \text{some}S_{i_1} \cdots \text{some}S_{i_l}k(X^1 \cap \overline{S})Y^{n+1}) \subseteq \text{some}S_{i_1} \cdots \text{some}S_{i_l}(k+1)X^1Y^{n+1}$ for each $k \in (\omega - \{0\})$

MG1. $(\text{some}S_{X^1} \cap \text{all}S_{i_1} \cdots \text{all}S_{i_1}\text{all}X^1Y^{n+1}) \subseteq \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{most}X^1Y^{n+1}$

MG2. $(\text{some}S_{X^1} \cap \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{some}S_{Y^{n+1}} \cap \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{most}(X^1 \cap \overline{S_i} \cap \overline{S_j})Y^{n+1}) \subseteq \text{some}S_{i_1} \cdots \text{some}S_{i_l}\text{most}X^1Y^{n+1}$
The inference rules of $L_{NQ}$ are the following.

**MP.** From $X^0$ and $X^0 \subseteq Y^0$ infer $Y^0$

**EI.** From $(Z^0 \cap \text{some} S X^1 \cap \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{some} S Y^{n+1})$, where $S$ does not occur in $X^1$, $Y^{n+1}$, or $Z^0$, and is distinct from $S_{i_1}, \ldots, S_{i_n}$, infer $(Z^0 \cap \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{some} X^1 Y^{n+1})$

**KI.** From $(Z^0 \cap \text{some} S X^1 \cap \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{some} S Y^{n+1} \cap \text{some} S_{i_1} \ldots \text{some} S_{i_k} (k+1) X^1 Y^{n+1})$ for each $k \in (\omega - \{0\})$

**MI.** From $(Z^0 \cap \text{some} S_{i_1} X^1 \cap \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{some} S_{i_1} Y^{n+1} \cap \text{all} S_{i_1} \ldots \text{all} S_{i_n} \text{all} X^1 Y^{n+1} \cup \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{most}(X^1 \cap \overline{S_{i_1} \cap S_{i_j}} Y^{n+1}))$, where $S_i$ and $S_j$ do not occur in $X^1$, $Y^{n+1}$, or $Z^0$, and are distinct from $S_{i_1}, \ldots, S_{i_n}$, infer $(Z^0 \cap \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{most} X^1 Y^{n+1})$

The set $T$ of theorems of $L_{NQ}$ is the smallest set containing the axioms and closed under MP, EI, KI, and MI.

Axiom S2 can also be written

**S2.** $\text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{all} S X^{n+1} \equiv \text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{some} S X^{n+1}$

In view of this "wild quantity" of singular predicates, $\text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{all} S X^{n+1}$ and $\text{some} S_{i_1} \ldots \text{some} S_{i_n} \text{some} S X^{n+1}$ will usually be written simply $S_{i_1} \ldots S_{i_n} S X^{n+1}$.
The following theorem establishes the soundness of this axiomatization.

**THEOREM 1** $X \in \mathcal{I}$ only if $\models X$.

**proof:** Observe that by the definition of satisfaction, $(\mathcal{F}(S_1), \ldots, \mathcal{F}(S_n)) \models X^n$ iff $(\mathcal{F}(S_1), \ldots, \mathcal{F}(S_n)) \models S_i X^n$ iff $\mathcal{I} \models S_i \cdots S_i X^n$. From this observation and the definition of validity, it is not difficult to show that the axioms are valid and that validity is preserved by the inference rules. Details will be given only for MG1, MG2 and MI. In this proof, $C_1 := \{d : \langle d \rangle \models X\}$, $C'_1 := \{d : \langle d \rangle \models X \cap S_j\}$, $C''_1 := \{d : \langle d \rangle \models X \cap \overline{S_j} \cap \overline{S_l}\}$, and $C_2 := \{d : \langle d, \mathcal{F}(S_i) \rangle, \ldots, \mathcal{F}(S_i) \rangle \models Y\}$.

(i) **Claim:** MG1 is valid.

**proof:** $\mathcal{I} \models SX \cap S_i \cdots S_i \text{allXY}$ iff $\mathcal{I} \models SX$ and $\mathcal{I} \models S_i \cdots S_i \text{allXY}$ iff $(\mathcal{F}(S)) \models X$ and $\forall d \in D : \langle d \rangle \models X$ implies $(\mathcal{F}(S_i), \ldots, \mathcal{F}(S_i)) \models Y$. Therefore, $\text{card}(C_1 \cap C_2) \geq 1$ and $\text{card}(C_1 \cap \overline{C_2}) = 0$. Hence $\mathcal{I} \models S_i \cdots S_i \text{mostXY}$.

(ii) **Claim:** MG2 is valid.

**proof:** As above, $\mathcal{I} \models S_i X \cap S_i \cdots S_i S_i Y \cap S_i \cdots S_i S_i \text{most}(X \cap \overline{S_i} \cap \overline{S_j})Y$ iff $(\mathcal{F}(S)) \models X$, $(\mathcal{F}(S_i), \mathcal{F}(S_i), \ldots, \mathcal{F}(S_i)) \models Y$, and $\text{card}(C''_1 \cap C_2) > \text{card}(C''_1 \cap C_2)$. Since $\mathcal{F}(S_i) \notin C''_1$ but $\mathcal{F}(S_i) \in C'_1$, $\text{card}(C'_1 \cap C_2) = \text{card}(C''_1 \cap C_2) + 1 > \text{card}(C''_1 \cap C_2) + 1 = \text{card}(C'_1 \cap \overline{C_2}) + 1$. Therefore, for any value of $\mathcal{F}(S_j)$, $\text{card}(C_1 \cap C_2) \geq \text{card}(C'_1 \cap C_2) > \text{card}(C'_1 \cap \overline{C_2}) + 1 \geq \text{card}(C_1 \cap \overline{C_2})$. Hence, $\mathcal{I} \models S_i \cdots S_i \text{mostXY}$.

(iii) **Claim:** MI preserves validity.
proof: Suppose $| (Z^o \cap S_i X \cap S_{i_n} \cdots S_{i-m} S_i Y \cap (S_{i_n} \cdots S_{i-m} S_i \text{all}_{XY}) \cup S_{i_n} \cdots S_{i-m} S_i \text{most}_{(X \cap S_i \cap S_j)Y})$, where $S_i$ and $S_j$ do not occur in $X$, $Y$, or $Z^o$, and are distinct from $S_{i_n}, \ldots, S_{i-m}$, but there exist interpretations $I$ such that $I \models Z^o \cap S_{i_n} \cdots S_{i-m} S_i \text{most}_{XY}$. Thus $\text{card}(C_1 \cap C_2) > \text{card}(C_1 \cap \overline{C_2}) \geq 0$. Since $S_i$ is fresh (i.e., has no other occurrences), there is an interpretation such that $F(S_i) \in C_1 \cap C_2$. Therefore, $I \models S_i X$ and $I \models S_{i_n} \cdots S_{i-m} S_i Y$. Now there are two cases to consider.

(a) $\text{card}(C_1 \cap \overline{C_2}) = 0$.

Then $I \nvdash S_{i_n} \cdots S_{i-m} S_i X \overline{Y}$, i.e., $I \models \overline{S_{i_n} \cdots S_{i-m} S_i Y}$, which contradicts the assumption.

(b) $\text{card}(C_1 \cap \overline{C_2}) > 0$.

Then $\text{card}(C_1 \cap C_2) > 1$. Since $S_j$ is fresh, there is an interpretation such that $F(S_j) \in C_1 \cap \overline{C_2}$. Therefore, $\text{card}(C_1'' \cap C_2) = \text{card}(C_1 \cap C_2) - 1$ and $\text{card}(C_1'' \cap \overline{C_2}) = \text{card}(C_1 \cap \overline{C_2}) - 1$. Hence $I \models S_{i_n} \cdots S_{i-m} \text{most}_{(X \cap \overline{S_i} \cap \overline{S_j})Y}$, which again contradicts the assumption.

\square

The axiomatization is not complete however. Indeed the quantifier most cannot be axiomatized in a first-order language. This is easily shown as follows. (See also [1].)

Suppose most is axiomatizable in $L_{NQ}$. Let $X = \text{most}_{TB}$ and let $\Gamma$ be a set of sentences such that for any interpretation $I$ of $L_{NQ}$, $I \models X$ iff $I \models \Gamma$. Let $n = \{0, 1, 2, \ldots, n - 1\}$ and $\omega_{\text{odd}} = \{1, 3, 5, \ldots\}$. For each $n \in \omega$, define interpretation
\[ I_n = (n, F_n), \text{ where } F_n(B) = \{0\} \cup n \cap \omega_{\text{odd}}. \] Obviously, for each \( n \in \omega \), \( I_n \models \Gamma \).

Now define \( I = \prod_{n \in \omega} I_n / F \), where \( F \) is a nonprincipal ultrafilter (e.g., an extension of the Frechét filter to an ultrafilter). By Loš’s Theorem (e.g., see [2]), \( I \models \Gamma \). Since \( F \) contains no singletons, \( \forall k \exists T \) cannot be satisfied in \( I \) for any \( k \). Therefore \( I \) is infinite. Moreover, \( (2k + 1)/F) \models B \) for every \( k \in \omega \). Since both \( T \) and \( B \) denote infinite sets in \( I \), it follows that \( I \not\models \text{most}TB \), a contradiction.

If the quantifier \text{most} \ were eliminated, the axiomatization of the remainder of \( \mathcal{L}_{NQ} \) would be complete. The proof closely follows that given in [3]. Alternatively, if interpretations are restricted to some fixed finite upper bound (e.g., by adding the axiom \( \bar{N}TT \)), the axiomatization is complete. Of course, this is tantamount to accepting incompleteness. In any event, incompleteness does not negate the usefulness of the axiomatization for reasoning about natural language discourse.
4 Theorems  The theorems presented in [3] can be generalized to apply to $\mathcal{L}_{NQ}$. Since the proofs closely follow those given in [3], the theorems will be stated without proof.

The main results are two monotonicity theorems. These theorems establish the monotonicity properties of quantifiers. They subsume the resolution principle. In addition, other properties of natural language quantifiers, including conservativity, are proved.

Before stating the first monotonicity theorem, some definitions are needed.

An occurrence of a subexpression $Y$ in an expression $W$ has positive (negative) polarity if that occurrence of $Y$ lies in the scope of an even (odd) number of $\neg$ operations in $W$, unless that occurrence of $Y$ is a subexpression of $V$ in $\text{most} \! V \! Z$, in which case $Y$ has both positive and negative polarity.

An occurrence of a subexpression $Y^m$, where $m \geq 1$, is governed by $X$ in $W$ if $W$ is $\text{some} \! X \! Y^m$, $\text{some} \! X \! \overline{Y}^m$, $\text{some} \! X \! (Y^m \cap Z^l)$, $k \! X \! Y^m$, $k \! X \! \overline{Y}^m$, $k \! X \! (Y^m \cap Z^l)$, $\text{most} \! X \! Y^m$, $\text{most} \! X \! \overline{Y}^m$, $\text{most} \! X \! (Y^m \cap Z^l)$, or the complement of one of these expressions. An occurrence of $Y^m$ is governed by $X_n \cdots X_1$ in $W$, where $1 \leq n \leq m$, if $V$ is governed by $X_n$ in $W$ and that occurrence of $Y^m$ is governed by $X_{n-1} \cdots X_1$ in $V$. An occurrence of $Y^m$ in $(k_1, \ldots, k_m)Y^m$ is governed by $X_{k_m} \cdots X_{k_1}$ in $W$ if $(k_1, \ldots, k_m)Y^m$ is governed by $X_n \cdots X_1$ in $W$, where $n = \max(k_i)_{1 \leq i \leq m}$.

**Theorem 2** (First Monotonicity Theorem) *Let $Y^m$ occur in $W$ with positive (respectively, negative) polarity. Let $(\text{allIT})^m(Y^m \subseteq Z^l)$ (respectively, $(\text{allIT})^m(Z^l \subseteq Y^m)$, \)
where \( l \leq m \). Let \( W' \) be obtained from \( W \) by (i) substituting \( Z^l \) for that occurrence of \( Y^m \), (ii) substituting \((k_1, \ldots, k_l)\) for selection operator \((k_1, \ldots, k_m)\) on \( Y^m \), if any, and (iii) eliminating all occurrences of governing subexpressions that no longer govern after the substitutions in (i) and (ii). Finally, let \( \text{some}T X \) for every governing subexpression \( X \) with an occurrence of negative polarity that was eliminated in (iii). Then \((\text{all}T)^h(W \subseteq W')\), where \( h \) is the arity of \( W \).

From previous definitions, it follows that if the expression \( \text{all}Y X \) occurs with positive (negative) polarity, then the occurrence of \( Y \) has negative (positive) polarity while the occurrence of \( X \) has positive (negative) polarity; if the expression \( \text{no}Y X \) occurs with positive (negative) polarity, then the occurrence of \( Y \) and the occurrence of \( X \) both have negative (positive) polarity; if the expression \( \text{!k}Y X \) occurs with either positive or negative polarity, then the occurrence of \( Y \) and the occurrence of \( X \) have both positive and negative polarity; if the expression \( \text{\tilde{k}}Y X \) occurs with positive (negative) polarity, then the occurrence of \( Y \) and the occurrence of \( X \) both have negative (positive) polarity; if the expression \( Y \subseteq X \) occurs with positive (negative) polarity, then the occurrence of \( Y \) has negative (positive) polarity while the occurrence of \( X \) has positive (negative) polarity; if the expression \( Y \cup X \) occurs with positive (negative) polarity, then the occurrence of \( Y \) and the occurrence of \( X \) both have positive (negative) polarity; and if the expression \( Y \equiv X \) occurs with either positive or negative polarity, then the occurrence of \( Y \) and the occurrence of \( X \) have both positive and negative polarity. With these provisions, Theorem 2 applies to expressions containing occurrences of defined operators. In this connection, singular predicates require
special mention. Since \( \text{all} S X := \overline{\text{some} \overline{S} X} \equiv \text{some} S \overline{X} \equiv \text{some} S X \), any occurrence of a singular predicate can be taken to have either positive or negative polarity.

Before the second monotonicity theorem can be presented, a definition is needed.

A subexpression \( Y^m \) will be said to occur disjunctively in expression \( W \) iff (i) \( W = \text{all} X_n \cdots \text{all} X_1 Y^m \cup Z \) where \( n \leq m \); or (ii) \( W = \text{all} X_n \cdots \text{all} X_{k+1}(Z_1 \cup Z_2) \) where \( 0 \leq k \leq n \) and \( Y^m \) occurs disjunctively in \( Z_1 \).

**THEOREM 3 (Second Monotonicity Theorem)** Let \( Y^m \) occur disjunctively in \( W \), governed by \( X_k \cdots X_1 \). Let \( W' \) be obtained from \( W \) by replacing that occurrence of \( Y^m \) with \( Z^l \) \((l \leq m)\) and deleting all occurrences of \( \text{all} X_i \) that no longer govern a subexpression. Let \( \text{some} T X_i \) for every \( \text{all} X_i \) that was deleted. Then \((\text{all} \ T)^h((W \cap \text{all} X_k \cdots \text{all} X_1 (Y^m \subset Z^l)) \subset W')\), where \( h \) is the arity of \( W \).

It is easy to see (from the equivalence \((Y^m \subset Z^l) \equiv (\overline{Y^m} \cup Z^l))\) that this theorem corresponds to the resolution principle in conventional logic. A corollary provides a rule corresponding to unit resolution.

**COROLLARY 4 (Cancellation Rule)** Let \( Y^m \) occur disjunctively in \( W \), governed by \( X_k \cdots X_1 \). Let \( W' \) be obtained from \( W \) by deleting that occurrence of \( Y^m \) and all occurrences of \( \text{all} X_i \) that no longer govern a subexpression. Let \( \text{some} T X_i \) for every \( \text{all} X_i \) that was deleted. Then \((\text{all} \ T)^h((W \cap \text{all} X_k \cdots \text{all} X_1 \overline{Y^m}) \subset W')\), where \( h \) is the arity of \( W \). \( \Box \)

The final theorems establish the property of conservativity and the the rules for
conversion in the case of unary predicates.

**THEOREM 5** (Conservativity) *(schema)* 
(i) \((allT)^{m-1}\text{some}XY^m \equiv (allT)^{m-1}\text{some}X(Y^m \cap X)\) 
(ii) \((allT)^{m-1}\text{all}XY^m \equiv (allT)^{m-1}\text{all}X(Y^m \cap X)\) 
(iii) \((allT)^{m-1}kXY^m \equiv (allT)^{m-1}kX(Y^m \cap X)\) 
(iv) \((allT)^{m-1}\text{most}XY^m \equiv (allT)^{m-1}\text{most}X(Y^m \cap X)\). □

**THEOREM 6** (Conversion) *For unary expressions X and Y, (i) someXY \equiv someYX* 
(ii) \(\text{allXY} \equiv \text{all}(\overline{Y}) \overline{X}\) (iii) \(kXY \equiv kYX\) □
5 Conclusion This paper generalizes the language $\mathcal{L}_N$ to include the cardinal quantifiers and the second-order quantifier most. The axiomatization of $\mathcal{L}_N$ is appropriately extended and the theorems establishing quantifier properties also extended.

The paper does not go on to prove other results involving these quantifiers, since they are for the most part quite straightforward. For example, the common-sense expectations such as

$$(kXY \cap \overline{2kXT}) \subseteq \text{most}XY$$

are easily obtained.

The main interest lies in the demonstration that a first-order language without identity has sufficient expressiveness to define these natural language quantifiers.
