LEAKINESS

Literal & Phenomenal
Claim

Architecture can be conscious of the ways in which it leaks.

Project

By designing a series of house-like pavilions that leak (fluids and information) in specific ways, this thesis will develop an explicit lexicon for architects to employ in managing the ‘metadata’ that buildings perpetually emit.

As a matter of design, these structures will operate on the leaked visible, non-visible, and absent metadata generated incidental to our occupation of buildings. The pavilions will ultimately probe similar sets of conditions, each conveying a radically different tone. Whether stopping or amplifying, scrambling or spoofing, deceiving or decoding, they seek to effect a measurable change on the metadata leaked from within.

In order to objectively critique their effects, the pavilions will initially tackle a single metadata type each possessing a distinct tone. Following these tests the pavilions will probe three or more forms of metadata leakage simultaneously, testing architecture’s capacity to consciously manage multiple forms of leakage.

Background

Architecture’s primordial task is to define interior space from the exterior world.

With its walls, it seeks to create absolute enclosures—shielding the prosaic elements of fire, air, earth, and water from its artificially conditioned, constructed interior realm. It privileges the purity of enclosed space employing the latest technologies to combat the forces of nature: erosion, weathering, and decay.

The envelope of architecture is a layered proposition where structure, material, aesthetics, and building code come together to form environmental enclosure. In addition to satisfying the primal human need for shelter by generating a refuge from the elements, the envelope has a social role in constructing feelings of comfort, notions of safety, expectations of privacy, and ideals of home. Its existence as a physical boundary tempers the way we behave within it. With its perceived air-tightness, architecture constructs a space disconnected from the forces of the external world.

However, architecture leaks. Water, air, and sound leak into and leak out of material assemblies. Universal properties such as thermal expansion, air and water pressure deviation, and weather work to erode the building envelope.

Architects are typically good at stopping leaks that can be sensorially perceived. However, architecture has long been subjected to the infiltration and exfiltration of elements that do not leave perceptible traces. Radio waves, thermal fingerprints, electromagnetic fields and digital data shadows generated by our every action are rarely consciously managed by architecture.

Freely flowing through the building envelope, these transmissions are largely impervious to the conventional material boundaries of architecture. In remaining neutral to these elements, architecture is susceptible to an alternate form of leakiness—one that does not necessarily constitute a material failure of the building envelope.

One can for this reason distinguish between a literal and phenomenal leakiness.

Where the condition of literal leakiness presupposes the existence of both a physical “hole or fissure” in the building’s envelope and a pressure differential between its interior and exterior, phenomenal leakiness does not.\(^1\)

Phenomenal leakiness is the condition by which the envelope of one’s occupancy is misaligned with the building envelope, broadcasting its occupation to the outside world. There is no clear physical boundary for this envelope, however, its presence is quantified in the form of visible, non-visible, or absent metadata. In synthetically reading this metadata one can infer the condition, position, and activities occurring within.

Architects currently unknowingly manage phenomenal leakiness as solely a visual condition. Operable or transparent windows and doors allow for images of occupancy to escape from architecture. In the present age of big data and state-sanctioned surveillance in which our personal metadata and data shadows serve to reveal, architecture has the potential to intervene by actively designing leakage.

This thesis posits that a more comprehensive leak management is an important addition to the disciplinary toolkit of architecture. Operating as critical plumbers of sorts, architects can form connections between material space that architecture typically inhabits and the immaterial ‘hertzian space’ generated by our ever-increasing engagement with networked technologies.

This work also aims to raise awareness to the consequences of leakage. In operating typologically at a domestic scale, the work will be accessible both to architects and the general public.

I. Taxonomy of Metadata
This catalog of metadata illustrates the differing types of leakage and their parent categorizations.

II. Leaky House
This probe serves to illustrate and identify the ways in which the envelope of the prototypical tract house (1958 Levittown Cape model) is ambivalent in managing phenomenal leakiness. Four images each illustrate the same fictitious condition of residential occupancy through vastly different types of metadata. When overlaid and aligned, they represent a fantastically transparent—synthetically eroding the building envelope through a study of its visible, non-visible, and absent metadatas.

III. NSA Pavilion
Where the Leaky House displays how residential architecture perpetually leaks, this translation of the NSA headquarters at Fort Meade displays how the atypical secure office building does not leak. In this translation, the building envelope becomes a charged zone of public occupation where one can experience the paranoid material approach employed throughout the building to stop the leakage of metadata and minimizing the informational imprint of the building. Within, an opaque volume clad in HVAC diffusers, standard ceiling tiles, and security cameras represents the most secure interior zone.

I. Taxonomy of Metadata

metadata
n. a set of data that describes and gives information about other data.

Similar to the way metadata imprinted on paper envelopes (postage, addresses, zip codes, names, security windows and patterns, paper stock and postmarks) leak the approximate size, origin, destination, path, and quality of its interior contents, the materiality, transparency, character, and composition of elements on a building’s envelope leak its internal spatial organization and hint at its occupation.3

Visible metadata ranging from the ephemeral to the environmental further quantifies phenomenal leakage. This metadata is active and ever-changing with building occupancy.
Ephemeral Urban Garbage

Visible

Red house number, Florence, Italy

Facade, Lafayette Park
Metadata invisible to the naked eye is also leaked through the building envelope comprised of wavelengths outside of the visible spectrum. They must be synthetically measured and imaged in order to quantify them.
Absent metadata defines the occupation of architecture specifically in reference to markers of location such as street address, zip code, ip address, cell tower triangulation, IEMI, mac address, or gps.

Fantastical Transparency

Through quantifying, measuring, visualizing, and overlaying multiple forms of phenomenal leakage, a synthetic approximation of a space’s occupancy is revealed—one that capitalizes on residential architecture’s inherent leakiness,

When contextualized within the post-Edward Snowden surveillance state, the ambivalence of the building envelope in perpetuating this fantastically transparent state should be challenged.
But hidden beneath the dark reflective finish is the real building, a skinlike cocoon of thick, orange-colored copper shielding to keep all signals—or any other type of electromagnetic radiation—from ever getting out. Known by the code name Tempest, this protective technique, used throughout much of the secret city, was designed to prevent electronic spies from capturing any escaping emissions. Like a black hole, NSA pulls in every signal that comes near, but no electron is ever allowed to escape.

Like the walls, the window through which Hayden was looking that bright December morning was specially designed to prevent eavesdropping. Made of two thick, bullet-proof-style panes, they contained hair-thin copper wires to seal in even the faintest electronic whisper. And to prevent sophisticated laser devices from capturing the telltale vibration of his voice on the glass, music played between the panes.

-James Bamford

*The Shadow Factory*
speakers spoof vibrations of glass
phased perimeter control
embedded copper mesh stops rf transmission
proliferation of security domes manages activity
tinted mirrored glass blocks light emission
thick bulletproof glass fortifies envelope
ample HVAC programs air
incinerator burns waste
Inside the NSA Pavilion, a member of the NSA Pavilion Police presides over the entrance—allowing only those into the office space above with the proper security clearance.

There, they synthesize the metadata of others while the machine they inhabit denies the leakage of theirs.

An informational janitor shreds and incinerates any sensitive or illegal metadata generated within the building’s bounds. This gesture perpetually expels white smoke into the atmosphere, itself a metadata of sorts.

The public inhabits the envelope. They peer through the black mirrored glass and copper shielding getting glimpses of the clandestine activities occurring within.

A continuous stair allows for a slow procession to the top as speakers continuously play noise-spoofing the vibrations on glass generated by internal conversation.

At the top, the hum of hidden HVAC units can be heard but not seen.
IV. Strategies for Metadata Management
Transmissions through the envelope are prevented at all costs. Employing a paranoic material and architectural strategy to eliminate the structure’s ability to be synthetically imaged and digitally eroded, the building envelope only accepts that which is required for human occupation and emits that which has been deemed sufficiently banal.

This new existence minimum imagines a future where surveillance mechanisms are omniscient. Privacy is no longer guaranteed by law demanding a bolstered physical boundary between outside and in.

Metadata leakage is enhanced and magnified by the building envelope. It leaks phenomenally and perpetually overwhelming would-be surveillors with information quantifying the building in its totality.

The building envelope intentionally jumbles and muddles the transmission of metadata creating a grey state of illegibility. The design of the building envelope operates similar to the way the shapes of stealth aircraft are optimized to minimize their informational imprints on radar screens (rather than to optimize their aerodynamic performance).

One form of leaked metadata purports to be another. In doing so, the changing forms of visual metadata associated with the house signify something alien. This is similar to the way aberrant structures such as pump houses, urban oil rigs, electrical substations, exhaust shafts, and cell antennae typologically spoof their true program. Often disguised as residences, tall buildings, flagpoles, and trees, they blend into their surrounding context.

False metadata will be leaked in order to suggest a specific interior condition similar to the way in timers can automatically turn lights on or off and mail and newspaper delivery can be temporarily stopped to suggest continuous occupation.

Non visible metadata will be imaged and displayed on the building envelope. Raising awareness as to the ways in which the house can leak, Decode House will be accessible in its candor to the general public.

VI. Leaky Pavilions
As a matter of design, these structures operate on the leaked visible, non-visible, and distant metadata generated incidental to our occupation of buildings. The pavilions ultimately probe similar sets of conditions, each conveying a radically different envelopic tone. Whether stopping, amplifying or dampening, they seek to effect a measurable change cloaking the metadata leaked from within.

Visualized primarily in their surveilled states, their designed leakage is amplified.

01 Stop

Transmissions through the envelope are minimized. Employing a paranoid material and architectural strategy to eliminate the structure’s ability to be surveilled, the building envelope only accepts that which is required for human occupation and emits that which has been deemed sufficiently banal.

02 Amplify

Metadata leakage is enhanced and magnified by the building envelope. It leaks phenomenally and perpetually—overwhelming would-be surveillors with information quantifying the building in its totality or falsely emitted metadata.

03 Dampen

The building envelope intentionally muddles the transmission of occupational metadata creating a grey state of illegibility. Metadata is made equal in intensity, blending in with the building’s urban surroundings or disassociated from its true intensity.
**Stop Operative Strategies**

**Block:**
- Dense materials (lead and copper) shield electromagnetic and radio frequencies.

**Suspend:**
- Utility use is suspended by disconnecting from the grid. The building is entirely powered by concealed renewable systems.
- Mail is delivered to an offsite location. It is read and securely transmitted to the house digitally.

**Minimize:**
- Thick section of board insulation minimizes thermal leakage and maximizes R value.
- Non-metal construction prevents heat-bridging
- Air leakage is stopped. A decompression chamber minimizes uncontrolled exchange of outside air.
STOP THERMAL
**Amplify Operative Strategies**

**Transparency:**

- Materials such as glass and plastics allow for visual transparency allowing a heightened reading of information quantifying the building’s interior (i.e. light, activity, occupancy).
- Through material choice, electromagnetic interference is minimized.
- Purposefully loose construction allows for heated air to perpetually escape.
- Exaggerated thermal bridges passively promote thermal leakage at the site of the building envelope.
- Refuse is automatically documented and made public.
- Mail is automatically documented and made public.

**Forced / Re-mark:**

- Interior conditions (temperature, WIFI / RF / EMF levels, light levels, etc.) can be measured by mechanical means and subsequently recreated and amplified.
- Shadows are projected onto the building’s envelope—collapsing interior occupancy onto the building’s elevation.
AMPLIFY THERMAL
Dampen Operative Strategies

**Transparency:**

- Materials such as glass and plastics allow for visual transparency allowing a heightened reading of information quantifying the building’s interior (i.e. light, activity, occupancy).

**Spoof:**

- A second skin muffles the true metadata leaked from the first decoupling the building’s surveilled appearance from its true interior activities.

**Average:**

- A second skin modulates light selectively leaked by the building’s first skin.
- Utility use is neutralized, dampening it relative to the neighborhood’s monthly averages.
- Utility use is averaged. Every month the house draws the same amount from the grid.

**Mask:**

- In order to mask variation in utility bills, concealed renewable resources kick-in once the average amount of electricity, gas, and water is drawn from the grid.
DAMPEN RF / EMF
VII. Privacy Parade
Tempered by recent revelations documenting the extent of the NSA’s domestic surveillance activities, we can imagine a future where the privacy constitutionally assigned to the home is challenged. In the near future one can imagine the need for a house able mask, deceive, and shield our informational emissions without necessarily stopping them absolutely.

Where square footage, economics, and architectural style were the primary criteria by which returning vets and their new families selected their Levittown abodes, their great-grand children will select their own SuperHouse based on issues of privacy, security, and ‘leakproofness.’ Existing as a new suburban typology, these five homes represent explorations projecting architecture’s role in managing personal and familial privacy needs. Combinations of three distinct architectural strategies are employed at the building envelope intending to subvert architecture’s inherent leakiness and strategically minimize its surveilability.

Currently, only those engaged in aberrant activities on the fringe of legality perform such evasive measures by visually altering the public appearance of their homes—keeping up appearances as to not raise suspicion. But in a world where surveillance can effectively make the home transparent, the metadata quantifying our banal residential activities needs to be consciously managed by architecture.
Rather than focusing on the newest aesthetic and lifestyle trends associated with residential interior design, this ‘parade of homes’ showcases the envelopic nature of privacy crafted by a leak-conscious architecture.

As a series, these model homes represent how acknowledgment of and response to architecture’s inherent leakiness can respond to divergent privacy desires.

Formally, they seek to amplify the envelopic nature of privacy by different typological means. The envelope becomes both an exterior and interior condition that manages intra-house and inter-house privacy.

Conceptually set in McLean, Virginia in close proximity to the US surveillance apparatus scenarios of their occupancy serve to inflate their plausibility.
Designed for the average Joe, House 1 responds to generic privacy concerns that pit contemporary expectations of connectivity against privacy.

**Interior:**

Its continuous interior envelope uniformly provides static visual and electromagnetic shielding. Shrouded in a faraday cage, emissions from this protected zone are minimized.

- Standard platform frame construction visually shields bedrooms, restrooms and the kitchen
- A copper mesh faraday cage blocks emissions and modulates the view out

**Exterior:**

Its segmented exterior envelope actively spoofs and screens emitted signals generated by activities occurring in the interstice of the two envelopes.

- Faced with copper mesh, a thick section of rigid board insulation, and embedded sheet metal faced with copper mesh, the exterior envelope blocks leaked metadata totally (save for punched windows mechanically shielded by an interior curtain)
- A transparent roof allows light and view into the house while wifi repeaters and thermal bridges decouple its surveilled appearance from its visual presence

**Form:**

Possessing a Levittown-like formal envelope, affectations signifying interior activity are kept to a minimum. Memories of distinctly residential architectural metadata occur when the interior slips past the exterior, generating protrusions reminiscent of a dormer or a bay window.
House 2 responds paranoically to the fringe privacy concerns of the tin foil hat-wearers and targeted individuals who demand total isolation.

**Exterior:**

Providing visual and aural shielding, the exterior envelope denies view into the house by day and minimizes light leakage by night

- Four similar mirrored glass facades visually shield the interior while non-conductive louvers on the roof deny the view in from above.

**Interior:**

Like a balloon frame house that renders adjacent rooms ‘pressurized’ and isolated from each other, this house’s hyper-fragmented interior provides total air-gapped insulation for its inhabitants.

- A myriad of isolated interior envelopes fragment the social order of the home.
- An air-locked circulation spine ensures the spatial isolation of each leaky space
- The public zones of the house become radically leaky, so as to spoof adjacent spaces
- Each bedroom generates a privacy distinctly tailored to the needs of its inhabitant.
- Independent vibration-dampened mechanical systems power each space—affording total environmental separation.

**Form:**

Seeking to decouple its form from its residential program, this house minimizes markers of domesticity such as the pitched roof, the casement window, or the garage door--becoming a platonic cubic volume sited inconspicuously on the suburban landscape.
House 3 responds to the privacy needs of a paranoid journalist who needs to assure displacement while pursuing stories that skirt the limits of free speech.

**Form:**

A singular banal house-like volume devoid of overtly domestic formal affectations serve to minimize phenomenally transparent programmatic readings of its interior.

**Interior:**

A series of nested envelopes generate a spectrum of interior zones from visually shielded to 100% blocked. Less private sacrificial zones at the perimeter of the house’s section are available to actively spoof conditions of interior occupancy.

- A series of nested envelopes deny the transmission of sound, and electromagnetic waves from within.

**Exterior:**

Its exterior envelope actively spoofs and screens emitted signals providing a semi-transparent redundant layer of security.

- Its skin modulates occupational metadata by mechanical means. (borrowing from the dampen pavilion)
House 4

House 4 responds to the divergent privacy needs of a CIA family—needing simultaneously to mask, stop, and displace.

**Interior:**

Overlapping interior envelopes generate a variety of leaky spaces defined spatially by the type of privacy they afford.

- A translucent faraday cage crafts electromagnetic privacy.
- A glass volume permits view in.
- A series of airgapped heavily insulated opaque volumes craft individualized thermal privacy.
- A series of opaque volumes solely craft visual privacy.
- A ring of transformable shielding spoofs and modulates ground floor leakage.

**Exterior:**

A bricolage of materials rather than a singular exterior envelope seeks to visually confuse.

**Form:**

Through its form, this architecture of accumulated volumes partially reveals the types of information allowed to pass. However, the collision of multiple envelope types makes it difficult for the surveillor to determine the exact source of the leaked information.
House 5 responds to the privacy needs of a politician who needs to ensure his contrasting public and private images.

**Exterior:**

A continuous, banal, McMansion-type envelope visually shields the home’s secure zones from public view.

- The normative envelope visually spoofs its internal occupancy.

**Interior:**

Fragmented into larger envelopic zones, more private leak-proof spaces are nested within the formal conventions of the suburban interior—allowing for social and secure fragmentation within the family.

- A larger zone within the building shields the transmission of heat.
- A translucent Faraday cage blocks the emissions of electromagnetic waves.
- Isolated zones nested within craft a privacy detached from the home but securely connected to the world.

**Form:**

The presence of domestic formal affectations such as dormers, window shutters, and modeled roof line suggest a degree of residential normalcy expected of the suburban elite.
